PADS Layout Classic 3D

Nutzen Sie die leistungsstarken Pads Standard Layoutfunktionen um gedruckte Leiterplatten schnell und einfach, unabhängig von ihrer Schaltung zu entwerfen: High-Speed, analoge und/oder digitale oder RF.

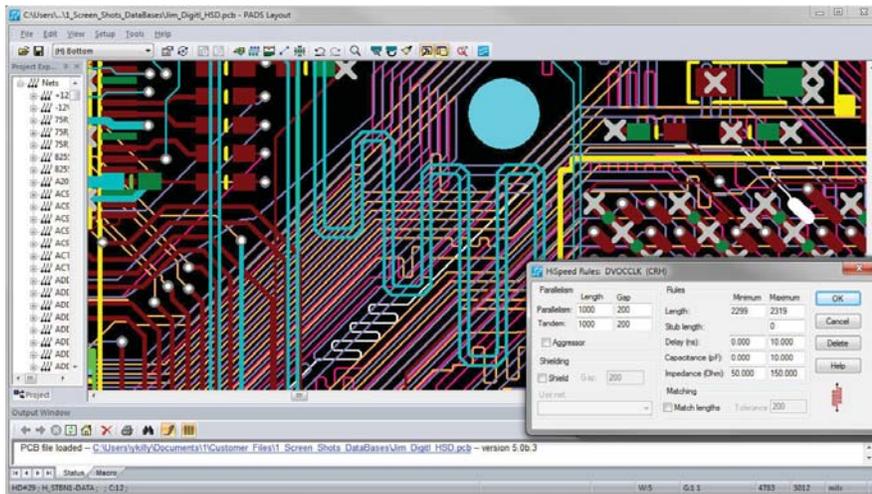

Unabhängig von der Komplexität des Entwurfs bewältigt PADS jeden Schritt des Entwurfsprozesses mit Effizienz und Benutzerfreundlichkeit.

Hersteller & für den Inhalt verantwortlich: Mentor Graphics

PADS Layout

For PADS Standard and PADS Standard Plus

PADS combines ease of use with great value and broad technology, making it ideal for PCB design applications.

OVERVIEW

Use PADS® powerful layout capabilities to design printed circuit boards quickly and easily, regardless of their circuitry: high-speed, analog and/or digital, or RF. No matter the complexity of your design, PADS can handle every step of the design process with efficiency and ease.

Get your design done faster with powerful physical design reuse, easy-to-use manufacturing prep, and advanced 3D layout. With full cross-probing between the schematic and layout, PADS will help you get your work done faster, with fewer re-spins and a better finished product. PADS Standard Plus also offers advanced options for chip-on-board/IC packaging support, time-saving Design for Test (DFT) audits, and high-speed autorouting.

PADS layout is included in all PADS configurations, including PADS Professional where it is dual-licensed with advanced technologies from Xpedition® PCB.

MAJOR BENEFITS:

- Easy to learn and use
- Powerful PCB design technology
- Proven capabilities
- Tackles complex design problems with accuracy and ease
- Used by tens of thousands of designers around the world
- Tight integration with simulation and analysis

PADS Customer Testimonial:

“With PADS I’m able to complete product designs much, much faster.”

Tech Validate ID: 657-8EA-F15

3D Viewing and Measuring

Full 3D visualization of the PCB includes components, pads, traces, vias, planes, silkscreen, soldermask, etc. This photorealistic view allows accurate inspections of the board prior to manufacture so that you can check for problems in the design. 3D viewing also provides a direct view of the board's internal layer stackup, giving you all the information needed to design your PCB knowledgeably and with confidence.

You can also measure distance and object-to-object minimum distance so that you can check how close or far you are from objects based on the constraints you set. You can also import covers, chassis, heatsinks, or other plug-in boards and other mechanical elements into PADS and check if they mate correctly.

STEP and Other Model Formats

Import component models and other mechanical models into PADS. Export full PCB assembly in STEP and other formats, e.g.: ASAT, IGS/IGES, SAT, and XTDA.

Placement

Schematic-Driven Placement

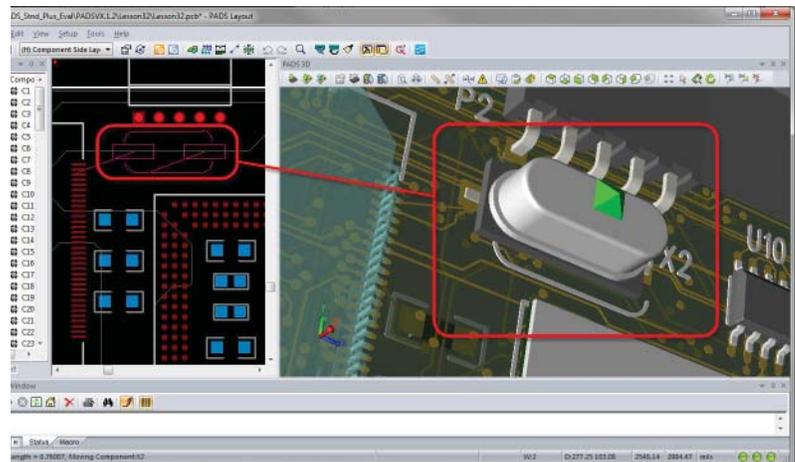

Powerful, bi-directional cross-probing between the schematic and layout make it easy to place components in PADS.

Simply select a group of parts on the schematic; the same parts will be selected simultaneously in the layout. Place parts one by one and each part will automatically attach

to the cursor in sequence, until all selected parts are placed, shortening placement time while improving product quality.

3D Placement

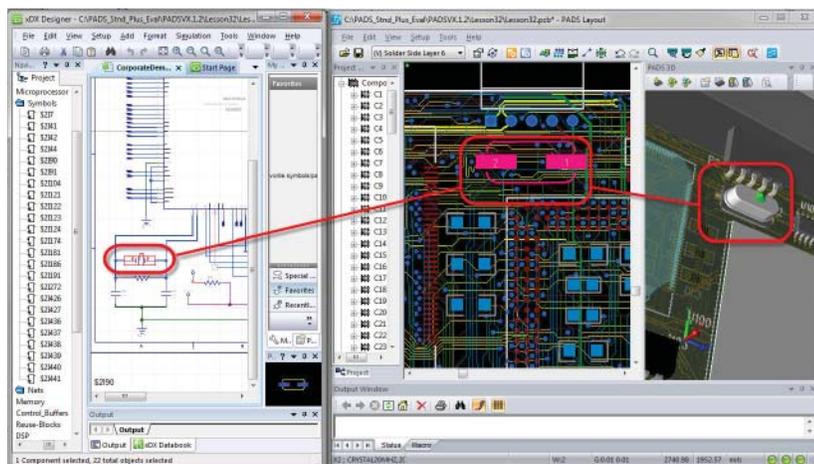

With PADS Standard Plus you can place components in 2D or 3D quickly and efficiently. 3D constraints and clearances ensure placements meet your design constraints with no violations, reducing design time.

Placing components in 3D helps you meet your 3D design constraints and reduce design time.

Component Unions

Save time and simplify the design process by using 'Unions' to associate multiple components for placement. For example, by creating a union of a BGA and capacitors, you can move all the parts at once, as though they were a single component.

Use bi-directional cross probing between the schematic and layout for better placement in shorter time.

Interactive Routing

PADS interactive routing is highly flexible, allowing you to choose how to drive routing and resolve potential clearance conflicts based on design rules. A particular strength for PADS is its proven 'push and shove' and 'rip-up and retry' technology for smooth, easy routing and excellent design quality and aesthetics.

Design Rules

Enforce design constraints through real-time feedback. Advanced design rule checks (DRCs) can be set to a variety of modes,

including Prevent, Explain, Warn, and Off. A filter can be enabled or disabled to detect violations by type (e.g., clearance, width, same net, placement, or length). Design rule checks adhere to all constraints, ensuring that no rule is violated and reducing rework after the board is completed.

With PADS Standard Plus, you can also run online 3D DRC during placement, or batch DRC for the entire design, based on the 3D clearances you define.

Guard Bands

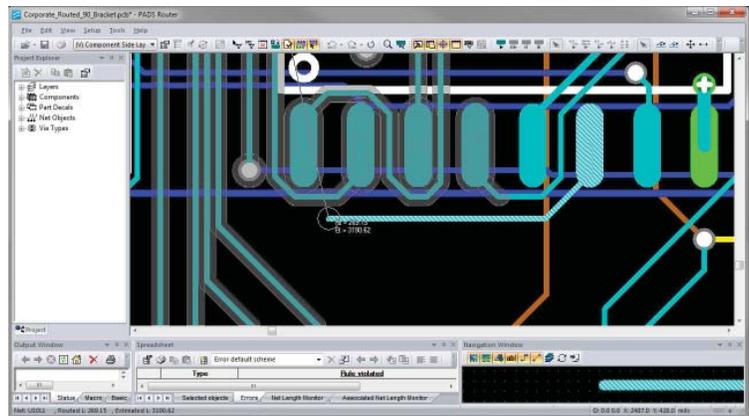

Maximize routing density by using 'guard bands' to show DRC boundaries. Keep-away boundaries can vary with each obstacle so guard bands are shown around each individual obstacle, rather than around the entire trace.

Trace-Length Monitor

A trace-length monitor displays the routed trace length, the estimated length to completion, and a progress indicator that shows whether a trace is violating or within its length constraints.

Autorouting

Setting up multiple routing passes is easy. Routing strategies allow you to route the board the way you want. Start with your critical nets and high-density components, then proceed with all remaining nets. Routing will adhere to your constraint hierarchy.

Guard bands help maximize routing density.

Route with diagonal (45° and 135°), rather than with 90°, trace corners to eliminate undesirable impedance changes caused by sharp corners.

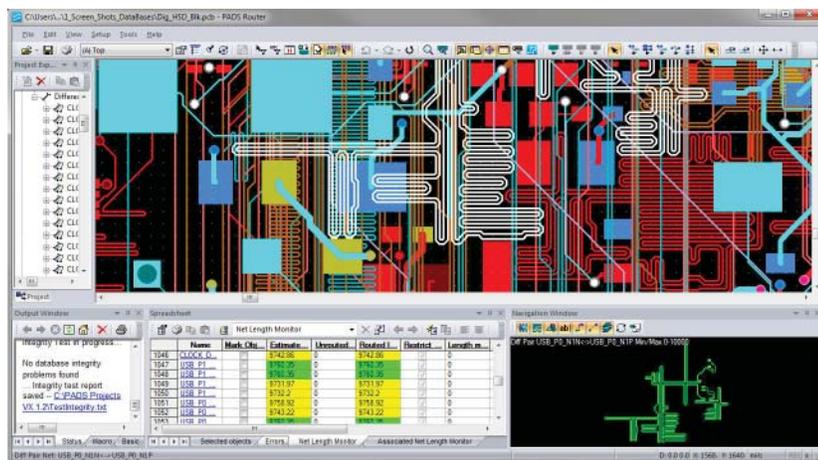

"PADS is reliable for complex layouts. The routing functions are convincing, saving lots of time and preventing errors."

TechValidate ID: E21-222-86D

PADS obeys all design rules for pad entry and fanouts based on the types of parts used. This ensures that the signal integrity and manufacturability requirements of your design are met. Robust design rules and advanced design constraints can be applied between objects or groups of objects, such as components, layers, nets, and vias.

High-Speed Routing

In PADS Standard Plus, you can use interactive routing to handle high-speed nets, differential pairs, and min/max and matched-length groups easily, enabling you to meet all required high-speed constraints.

Interactive routing of a differential pair with an accordion (zigzag) pattern for length control.

Optional licensing lets you apply these interactive high-speed routing capabilities to automatic routing as well.

RF Design

Support for RF and microwave design includes direct DXF import of complex copper shapes and line geometries, via shielding for channel/co-planar waveguide design, automatic via fill for any copper shape, and support for chamfered or square corners.

Definition of Split Planes and Copper Pour Areas

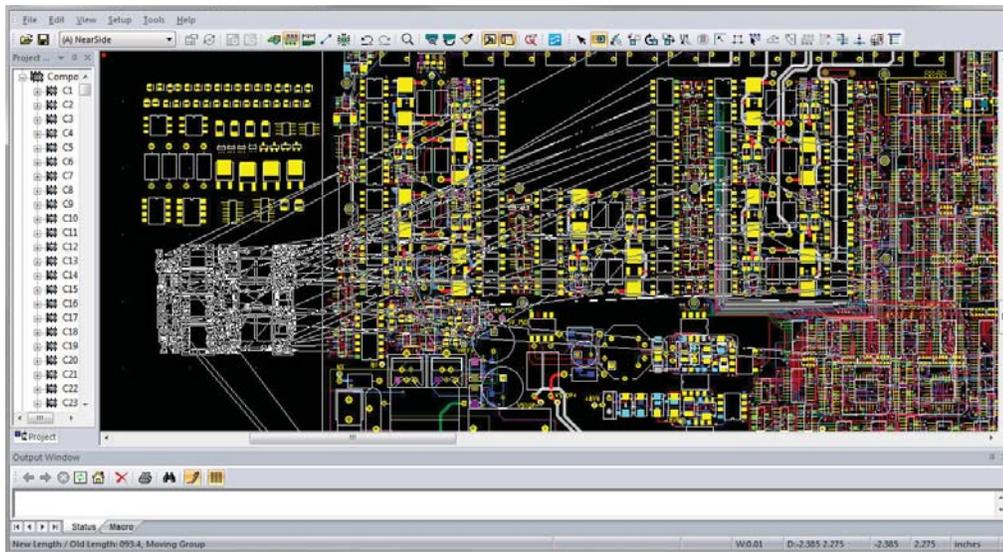

- Create complex copper-pour areas and embedded split planes. With PADS you can:
- Ensure an electrically correct design by automatically checking connectivity to multiple split-plane and copper-pour areas
- Maintain all design rules, including net-specific and conditional net rules
- Easily separate embedded planes into multiple plane polygons
- Support embedded traces on internal plane layers and through copper areas
- Support positive and negative plane areas.

Physical Design Reuse (PDR)

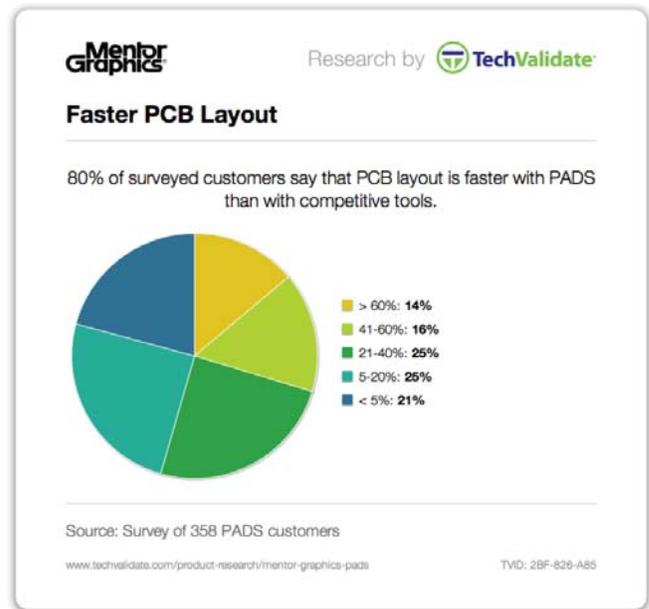

PADS Standard Plus includes easy-to-use, intuitive capabilities for physical design reuse. Quickly place repetitive circuits in multi-channel designs or reuse prove circuitry from a “golden circuit” to shorten design time, increase productivity, ensure product quality, and drive efficiency throughout the PCB design process.

Signal Integrity (SI) Verification

PADS Standard Plus includes powerful and easy-to-use SI analysis and verification capabilities to help ensure your design goals are met, without you having to be an SI engineer. Avoid time-consuming set-up errors and

Physical design reuse significantly reduces design time and improves quality through efficient reuse of proven technology.

unroutable constraints with pre-route analysis and confirm that your design rules and constraints are met using a batch design rule check with post-layout verification.

With PADS, you can test your design integrity at the three most critical stages of the PCB design process: following part placement, after critical net routing, and after detailed routing of the entire board.

Manufacturing Prep

Optimize product quality and reduce cycle time and costs with built-in audits for Design for Fabrication (DFF) to detect and resolve manufacturing problems early.

If you need to perform testability analysis and verification and ensure 100% testability for all nets on your board, there's an option to add Design for Test (DFT) audits to your PADS Standard Plus seat. With this option, you can locate, identify, and amend

any manufacturing rules violations concealed in your design in a matter of minutes.

Support for Analog Design

Automatic and interactive jumper capabilities with advanced teardrop and pad-filleting controls for high-density, single- and double-sided boards, make sure your design will meet design rules and requirements.

Automation and Scripting

For advanced integration and customization, PADS includes Object Linking and Embedding (OLE) automation methods and a scripting engine compatible with Visual Basic.

Application Program Interface (API) options provide direct access to the PADS data structure for faster, better communication among design tools.

Documentation

Auto-dimensioning

PADS includes dimensioning tools that document the PCB form factor automatically. These tools include datum and standard dimensioning, radius, angle, and leader support as well as user-defined tolerances.

CAM output

CAM utilities output ODB++, drill data, Gerber, and other standard data-exchange formats.

IDF link

An IDF link allows 2D physical information to pass to and from PADS and mechanical engineering tools, such as Creo Parametric and SolidWorks.

3D PDF | STEP

Quickly export a 3D PDF or STEP file of your design for reporting purposes, or to send to you manufacturer for better understanding of your design intent.

Additional Capabilities for PADS Standard Plus

Create the tool set that works for your design requirements. Add high-speed routing, DFT, MCAD co-design, and more with these options for PADS Standard Plus.

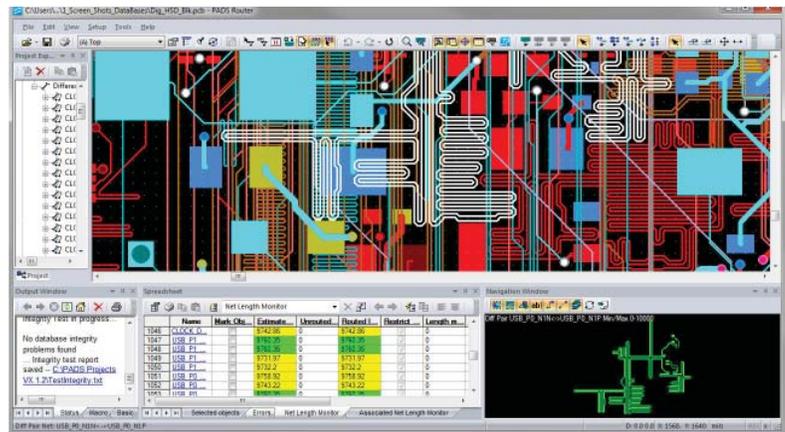

Advanced PCB Layout Option

1. DFT

Traditionally, design testpoints are added after routing. This adds a step to the design process, hinders productivity, and can compromise design integrity. With the Advanced PCB Layout bundle, ATE testpoints are inserted automatically during routing for superior results. Integrated DFT routing reduces time spent in post-route and manual testpoint placement.

2. High-Speed Autorouting

Meet all required high-speed constraints with automatic routing of high-speed nets, differential pairs, and min/max and matched-length groups easily. Included in the Advanced PCB Layout bundle for PADS Standard Plus.

High-speed autorouting includes advanced layout features.

3. Support for Advanced Packaging

Improve design quality by automating key aspects when designing with bare die. With a variety of die, die flag, and route wizards and tools, the Advanced PCB Layout option includes an advanced toolkit for speeding design reuse, creating manufacturing data, and designing grid arrays (BGAs), chip-scale packages (CSPs), multi-chip modules packages (MCM), and COBs.

DFM Analysis Option

Ensure that your design is manufacturing-ready. This option includes more than 100 of the most commonly used fabrication and assembly analyses, making it easy to identify issues like resist slivers, unintended copper, and improper testpoint-to-testpoint spacing that can cause production delays. Available only with PADS Standard Plus.

MCAD Collaboration

Communicate design intent between electrical and mechanical CAD systems using the PADS MCAD Collaborator option, available only with PADS Standard Plus. Both you and the mechanical engineer stay in your respective system's comfort zone, making collaboration effective and convenient. Works with the industry's leading ECAD and MCAD tools, including PTC Creo, Siemens NX, and Dassault Systèmes' SolidWorks and CATIA.

Use PADS for Complete, Fast, Easy PCB Layout Design

PADS Standard and PADS Standard Plus provide a highly productive, easy-to-learn, and easy-to-use environment for PCB design. With PADS you can complete simple designs easily, and challenging designs faster, following all rules for design integrity and manufacturability, while eliminating re-spins and schedule delays.

With PADS, you can design with confidence and get your job done right the first time.
